

* Application: weather forecasting and climate modelling

How parallel computing is used:

- ↳ massive simulations of atmosphere conditions are run using complex mathematical models
- ↳ This requires high performance computing (HPC) systems with thousands of CPUs / GPUs running tasks in parallel.

Without parallel computing, weeks of weather data would take long time to -practically useful.

Use of network systems:

- ↳ Enable real-time communication between players across the globe.
- ↳ Allow cloud based matchmaking, player authentication, and game state storage
